

SERVICE
P10AP

The Pregnancy Milk Test is not valid and should not be used at less than 60 DIM or less than 26 days bred. *

The ELISA value is an indication of the detected level of pregnancy associated glycoproteins (PAGs), a reliable marker for pregnancy.

Days bred is also being considered in the `Test Results Interpretation`; therefore, for best results please provide breeding information.

An Inconclusive result is either a true pregnancy where PAGs are on the increase, or may be a recent loss of pregnancy where PAGs are on the decline. Inconclusive results are provided at no charge.

***** CanWest DHI accepts no responsibility for any loss or damage arising from the use and interpretation of these results.**

Cow Name	Chain #	Lact #	Days in Milk	Field Reported Reproduction Status	Days Last Bred or Carried Calf	ELISA Value (max 4.4)	Test Results Interpretation
